Initial prioritisation of topics

Topic	Enhancements	Priority - Stefan	Priority - Joost	Comments
SFA				
	When authenticating multiple times with an open session you are requested to present your second factor	High (to make this configurable, as it also has an upside)		A.L – This relates to the issue posted on GitHub. It seems that this would degrade the user SSO experience and so should be addressed. A good solution needs proposing. Priority – High.
	Per user authentication based on attributes in the backend system rather than the DB	Medium		A.L – This seems beneficial for the administrators – High
	Standalone registration page to allow registration of another authenticator if a user has one	High		A.L – It seems likely that some users would have other means of authenticating e.g. client certificate - High
FFA	Implement passwordless authentication with a FIDO token using CTAP	Medium (very useful for a business that starts fresh with a new customer - but that's not "us")		A.L – An important feature of FIDO2 that improves overall security and is rolled out already by many commercial vendors. Less important than SFA work for R&E? – Medium
General				
	Add an admin module to deal with issues such as suspension and revocation of tokens. Also renewal and replacement.	High		A.L – Seems to be currently a missing feature – Medium
	Make improvements to improve overall deployment and configuration of the module, such as exposing the configuration API via JS, and UI improvements	Low (UI already integrated in Twig and following overall style)		A-L – Part of the process to make the implementation more solid and useable – Medium
	Implementation of MVC controller class for scripts	Low		A.L – Better way to handle the flow logic than scripts and easier to test against. – Low

	Create DB on first run if it does not exist	Medium (lower the barrier to entry for admins)		A.L – Useful automation of manual steps - Low
