CITAF

Czech Infrastructure for Time and Frequency

- To be a national platform for cooperation in research and development of methods of time and frequency transmission in optical networks;
- To establish a permanent national optical infrastructure for the transmission of time and frequency and interconnect it to the follow-up European infrastructure;
- To support joint publishing activities of partners and cooperation in national and international projects and grants;
- Present the results of cooperation and develop an awareness of the possibilities and use of the distribution of very accurate time and stable frequency.

CITAF has currently 6 partners

- three institutes
- two faculties
- CESNET

<http://citaf.org>

Time Distribution in CESNET Network - 2024

Accurate White Rabbit service in CESNET network (2024)

- Service available in 6 nodes at university or research institute
- WR-LEN are being replaced by WRS technology
- Operate a reliable distributed WR system is a challenge
 - monitoring
 - resilience

Optical network infrastructure

- Shared with data services
- Bidirectional transfer over dedicated channel in commercial DWDM
- Bidirectional amplifiers in telecom huts

NATIONAL WHITE RABBIT NETWORK

Standard WRS

- <https://white-rabbit.web.cern.ch/>
- **Modes: BC (boundary clock), GM (grand-master), FR (free running)**
- **Modes are configurable but fall down to FR in case of reference issue**
 - Sometimes do not return back to BC / GM - difficult to reproduce
- **No possibility to switch from GM to BC in case of RF signal fail**
- **No direct indication of mode or mode change (i.e. LED change)**
 - Mode and other running parameters accessible by SNMP

Several issues of standard WRS that complicate use for 24/7 service or in large heterogeneous and multidomain setup:

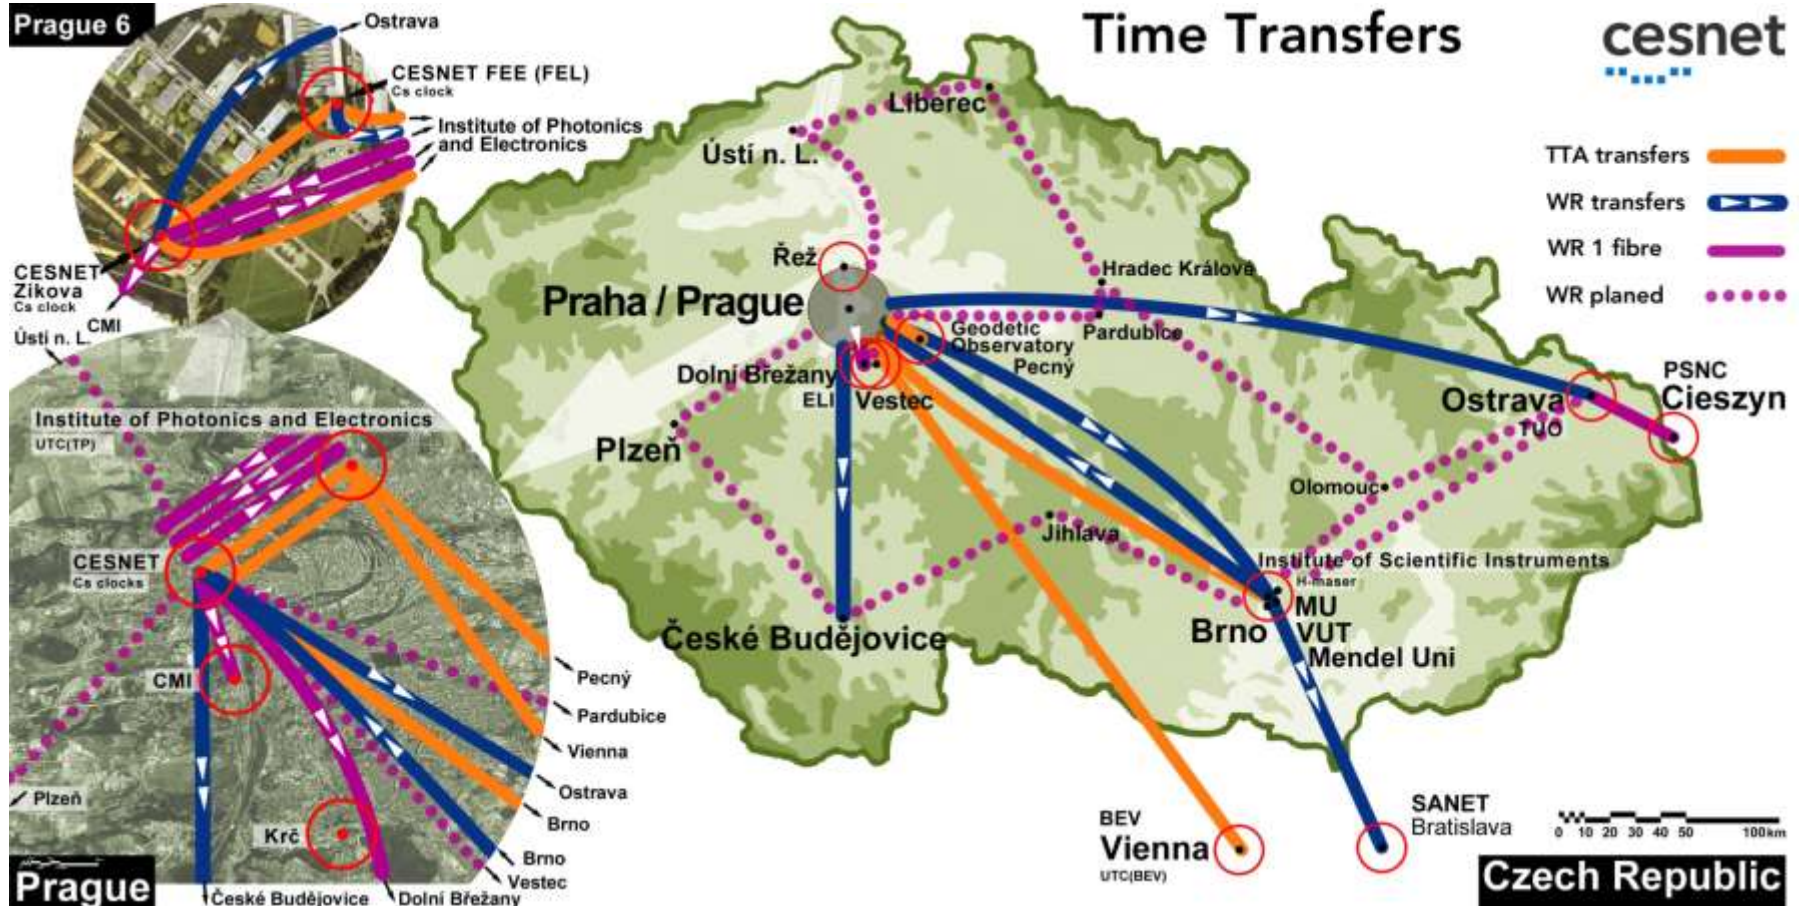

- Only one port port might be configured as slave
- No possibility to switch from GM to BC in case of RF signal fail
 - Box requires reconfiguration in case of lost reference
- Identification of network failure requires active monitoring
- SFP calibration parameters tied with #PN
 - Impossible to calibrate more SFP of the same type

In 2024 started a large national project aimed at modernization of CESNET optical network

- **Sub-goal: Infrastructure for accurate time distribution**

- **20 Points-of-Presence with WR switch**
 - including WR PoPs in neighboring countries: AT (Vienna), Poland (Cieszyn), SK (Bratislava)
 - **Advanced WR boxes**
 - multiple switchable references
 - redundant power supply
 - **Reserved bandwidth (move to “near” L-band)**
 - **Dedicated bidirectional amplifiers**
 - **Two independent sources of accurate time traceable to UTC(TP)**
 - H-masers in Cesnet (Prague) and UPT (Brno)
- 
- A decorative graphic at the bottom of the slide consisting of a horizontal line of small blue squares of varying heights, creating a pixelated or digital effect.

WR boxes with several reference inputs

- Specified priority of inputs (SFP ports and RF)
- Holdover mode with defined duration
- Automatic switching to another input in case of signal failure
- Recovery once higher priority signal is available again
- Switching as fast as possible
 - No box with immediate switching yet available ??

WR-Z16

Example: WR-Z16 from Safran/ SevenSolutions

- two reference SFP ports
- 1PPS / 10 MHz inputs
- input switching takes tens of seconds

■ Design Considerations

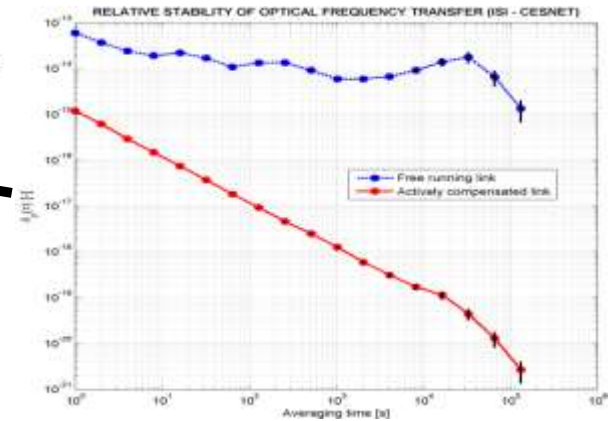

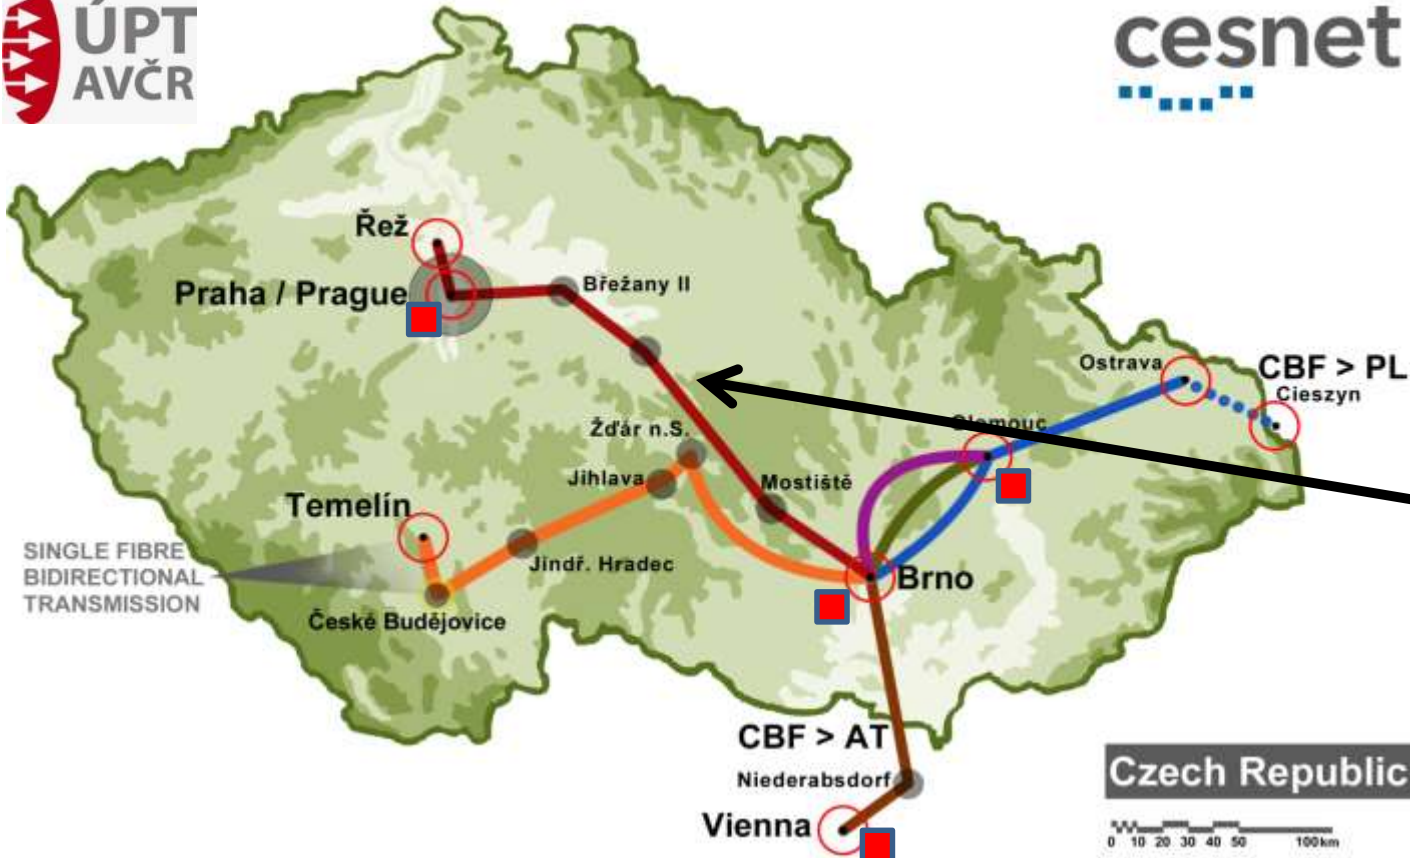

- Spectrum shared - among DATA, COF and WR
- OADMs
- WR regeneration or amplification
- Common EDFAs for T and F or distinct
- Synchronisation and Quantum

■ Monitoring

- White Rabbit
 - Bidi EDFAs
 - Coherent Optical Frequency
- 
- A decorative horizontal line at the bottom of the slide consisting of a series of small blue squares of varying sizes and colors, creating a pixelated or digital effect.

■ Optical clock (incl under development)

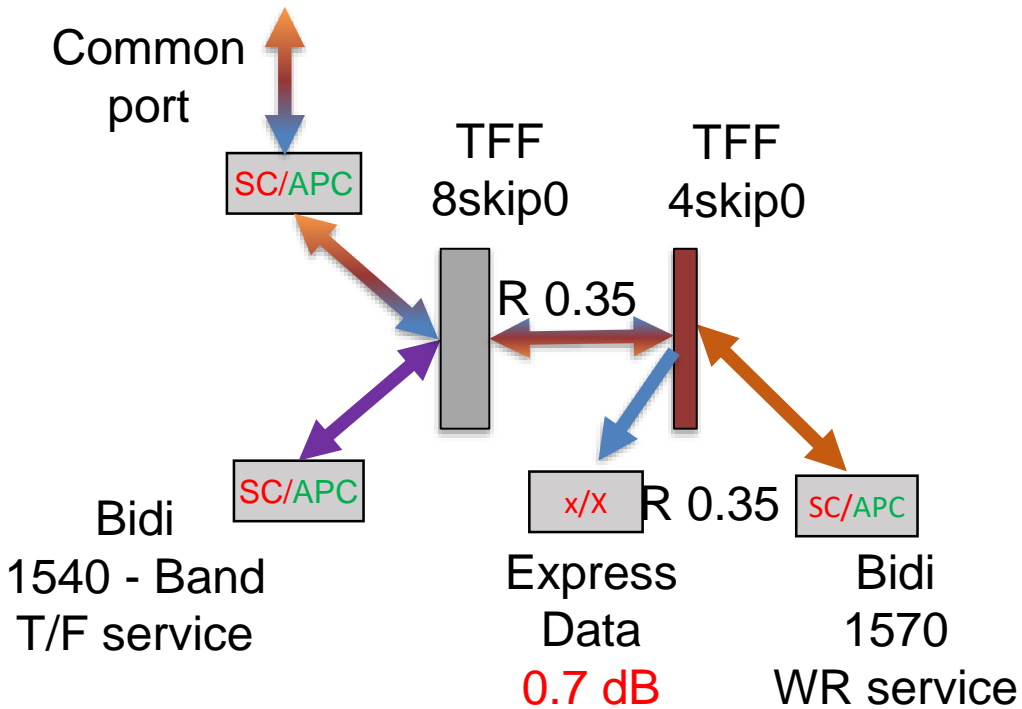

CESNET Praha - UPT Brno 306 km,
ADEV 10⁻¹⁸ @ 10³ s

- Fibre infrastructure 5800 km approx., coherent 100-400Gbps per lambda
- For time and frequency dedicated all-optical bidirectional bandwidth reserved (skipping telco equipment)
- 120 pcs. of OADMs deployed mainly in 2021
- Dual window OADMs installed: 46-39ch and 9-6 ch
- COF hannels 44+46, ready for ch 7
- One line with 1458nm COF transfer (Ca+ clocks)
- Bidi EDFAs used to compensate losses (cca 28 pcs. now)

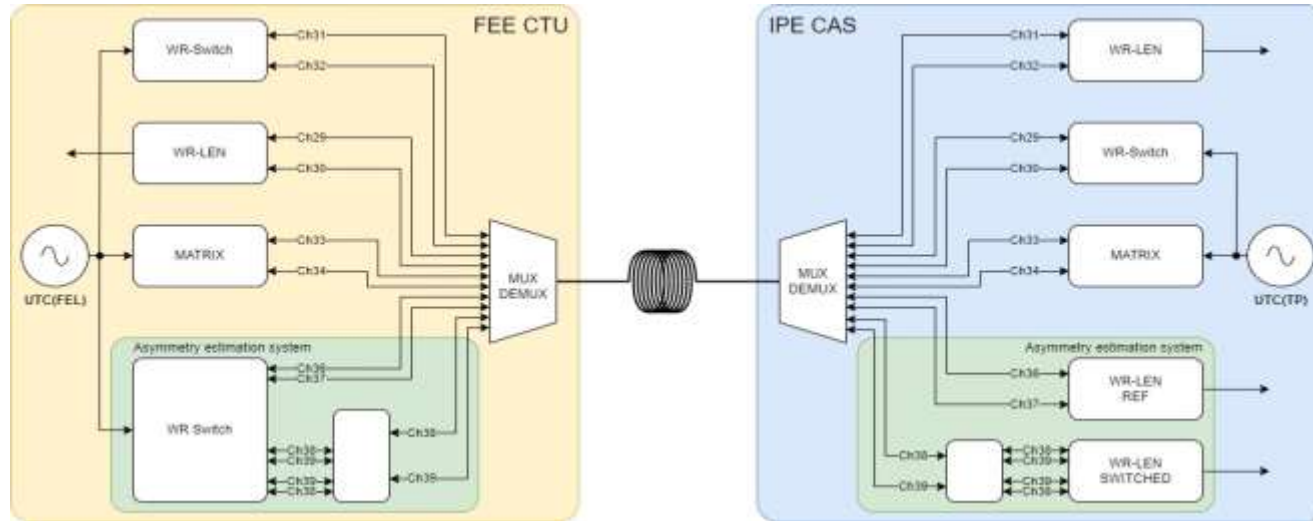

- Dual band OADM

- Established shared channel 2015
- 308 km, 5 and later 6 bidiEDFAs
- Possible however.....
- Noise accumulates in bidi channel fast
 - COF - lower OSNR is acceptable
 - WR - need decent OSNR

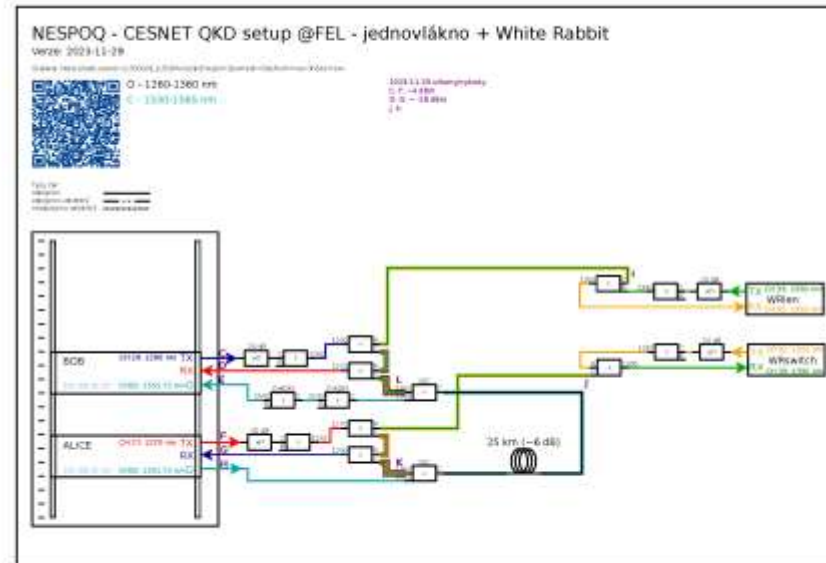

Multiple transfers in single fibre

Michal Špaček et al. "System for continuous evaluation of optical path asymmetry"; <https://doi.org/10.1117/12.2678936>
 Line calibration described by E. Dierikx and Y. Xie, White Rabbit Good Practice Guide, May 2019

- Parallel transfer – doable but....
- WR – relatively strong signals
- Q channel 1550 nm – spont. Raman photons
- Q channel 1310 nm
 - 1.6 times short reach
 - 90km instead 150km

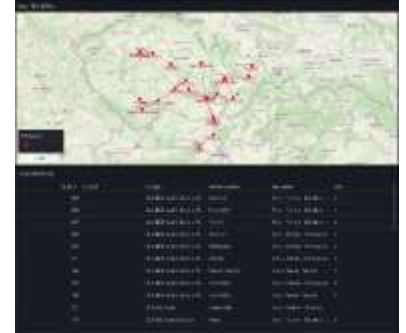

Goals

- Monitoring and control of bidi EDFAs (1600km already in operation)
- Monitoring of complete WR network status
- Monitoring of COF transfer status
- Check for failures and network changes

Integration with currently deployed monitoring solution

- Grafana
- Victoria Metrics
- Telegraf

Centralized dashboard for both Open HW and Z16 variants of the WR Switch

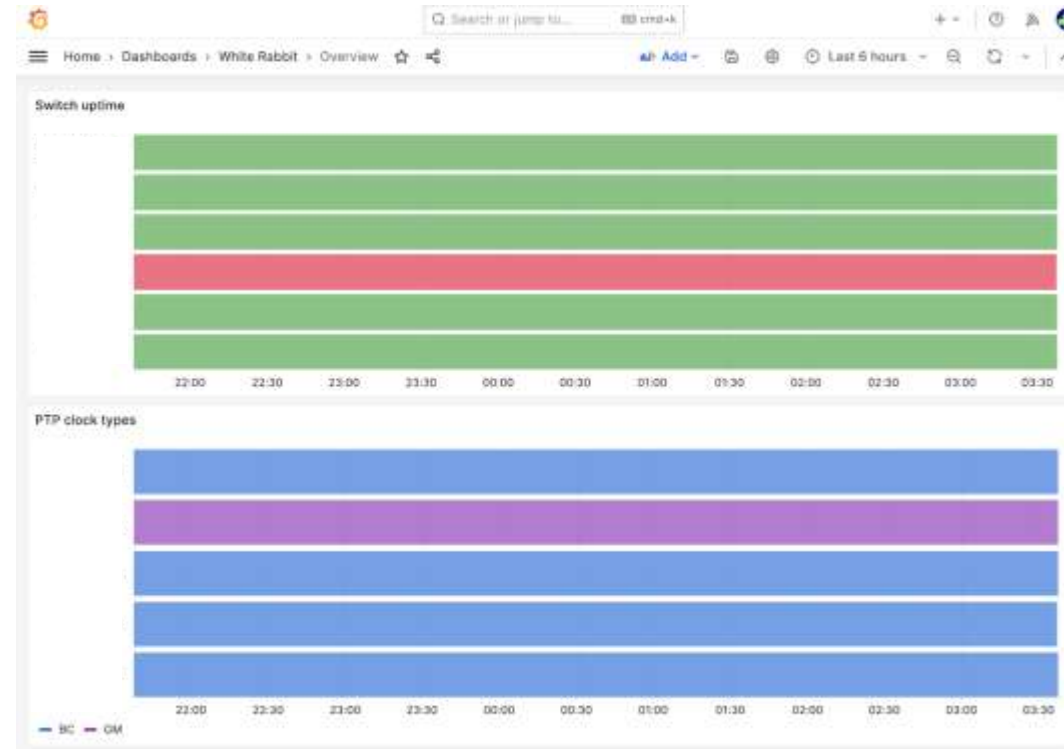

■ Open Hardware WRS

- Data collection through SNMP
- Directly using SNMP plugin in Telegraf

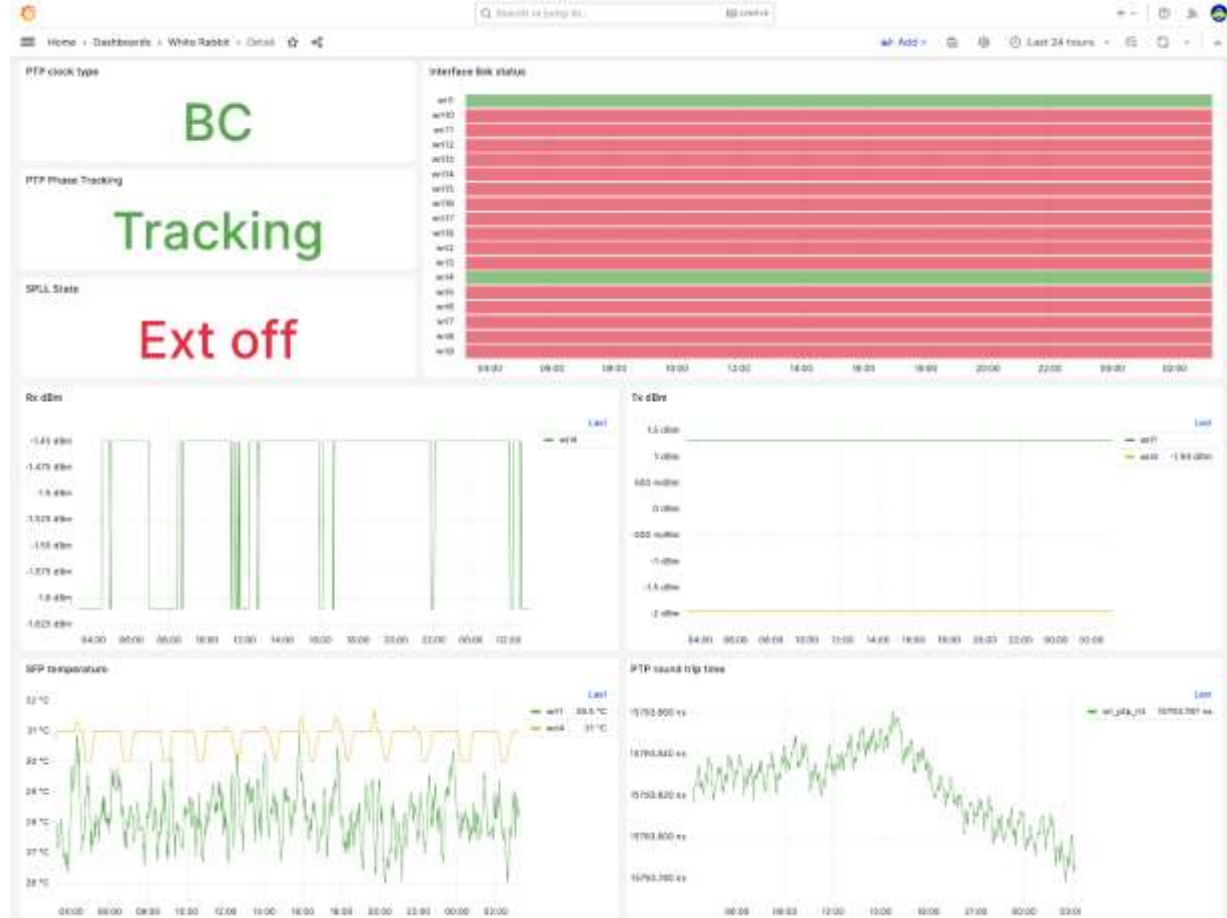

■ WRS-Z16

- Data collection through REST API
- Python script feeding data into Telegraf
- Acquired data mapped to corresponding WRS values to ensure full compatibility

Collected data

- Clock type
- WR status
- SFP link status
- SFP Rx and Tx power
- SFP temperature
- PTP round trip time

- **Data acquisition protocols**

SNMPv2/3 – many data from optical layer & system

SSH – some system data by Ansible playbooks

- **Data storage**

VictoriaMetrics – lightweight powerful time series database:

positive experience (6 months ~

436 M datapoints; 59 MB space on disk

for (optical power levels, attenuations, wavelengths, . . .)

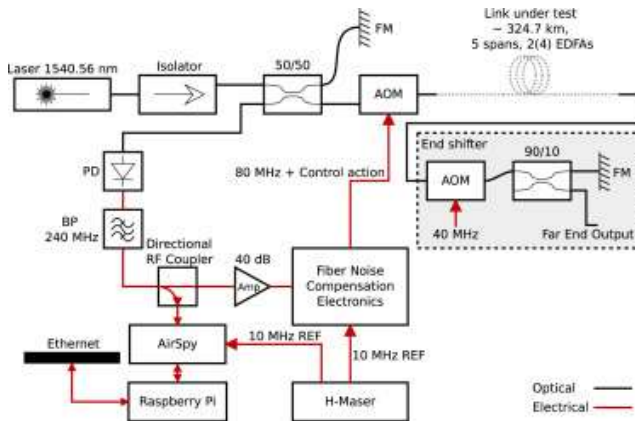

- **Data view**

CLManager – in-house developed CMS for CzechLight boxes

Grafana – interactive, powerful and highly customizable dashboard system

- Evaluation of beatnote signal at RLS
- Link Quality Index (LQI) proposed
- The goal of LQI is to determine the state of the link before undesired lasing or transfer drop emerge.
- Used for balancing of gain of EDFA amplifiers cascade.

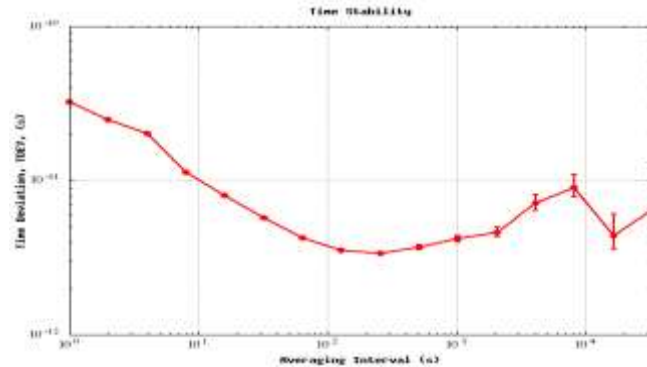

M. Slapak et al: Stabilization of super coherent frequency transfers via amplifier cascade balancing. Oct 2024 <https://doi.org/10.1016/j.yofte.2024.103910>

**We are open and looking for
cooperation and experience Exchange.
Thank You very much for kind attention!
Questions?**
