VoIP6 provider wanted

This page is aimed at VoIP providers in the Netherlands

We currently have a phone system that consists of a local Asterisk server with quad BRI cards connected to the KPN ISDN network, and ~ 20 SIP phones.

We'd like to replace this with a new set-up that supports IPv6.

Therefore we are looking for a VoIP6 provider.

If you can offer such a service in the Netherlands, please contact us at hostmaster@terena.org. We're willing to work together in any SIP6/VoIP6 trials, test setups, etc. We are also open to different approaches:

- IPv6-only phones registering on a local system (preferably a VM) and trunking calls to a provider
- Provider running everything and only have IPv6 phones in the office
- Other ideas?

If you are VoIP4 provider and are interested in extending your business with IPv6, also contact us.

This is mostly uncharted territory, so if we manage to get things working, you'll have a competitive business advantage.

P.S. I'm tired of the lame excuses that always seems to come up whenever I speak with vendors about IPv6:

> *We don't support IPv6 because there is no demand for it.*

Well guess what: there is no demand ***because there is not support*** for it.
This page is to break out of this circle and tell you that there really IS demand for it!
If you offer IPv6, we will want to do business with you.
